🛡️ WP Sentinel v4.4

The Enterprise-Grade WordPress Security Suite

WP Sentinel is a comprehensive, proactive security plugin designed to protect WordPress installations from modern web threats. It operates similarly to industry-leading solutions, utilizing an early-loading firewall, deep data scanning, and active traffic analysis.

Core Features Included in v4.4

🔥 1. Web Application Firewall (WAF)

The WAF intercepts every incoming HTTP request before WordPress core fully loads. It analyzes the payloads (GET, POST, COOKIES) masking bad characters and blocks malicious attacks instantly.

- **SQL Injection (SQLi) Protection:** Drops queries attempting to manipulate your database constraints.
- **Cross-Site Scripting (XSS):** Stops malicious scripts from being injected into your DOM.
- **Local File Inclusion (LFI):** Prevents hackers from accessing sensitive server files via path traversal.

🕵️ 2. Deep Malware & Core Integrity Scanner

An advanced recursive scanner that checks every plugin and theme file for known, heavily obfuscated PHP malware payloads.

- **WordPress API Verification:** Communicates securely with `api.wordpress.org` to fetch official file checksums, immediately alerting administrators if core files (like `wp-load.php`) are modified.

- **Automated Scanning:** Hooks directly into WP-Cron to conduct deep scans daily in the background.

📡 3. Live Traffic Analytics & Rate Limiting

WP Sentinel logs request data in real-time without bloating your primary WordPress tables, empowering administrators to view what is happening on their servers right now.

- **Human vs. Bot Detection:** See exactly who is attempting to crawl or load pages.
- **DDoS & Crawler Rate Limiting:** Any IP that exceeds 180 requests per minute is instantly blocked, conserving server CPU and stopping automated vulnerability scanners in their tracks.

🔒 4. Brute Force & Login Protection

Hardens the authentication gateways preventing widespread credential stuffing.

- **IP Lockouts:** Fails 5 times? The IP address is banned from logging in for 24 hours.
- **Two-Factor Authentication (2FA):** Requires administrative logins to retrieve and enter a secure 6-digit OTP code emailed to their address.
- **XML-RPC Disabler:** Closes the most commonly abused endpoint in WordPress.

📊 5. Security Posture Dashboard

A modernized, premium admin interface that visualizes data clearly.

- **Security Score:** A dynamic, graded circle showing exactly how secure the installation is.
- **Live Threat Reporting:** A table natively injected into the dashboard summarizing the exact IPs and rules tripped over the last 24 hours.
